

Wonders of the Wild (Short Subject)

Discovery Channel International

Are dolphins as smart as humans? Some people think so.

Like humans, dolphins rely on sound to communicate. They “speak” by emitting clicks, whistles, and squeaks through the rounded region of their forehead, called the melon.

For years, scientists have tried to unravel the mysterious underwater world of the dolphin.

After much study, we’ve learned to “talk” to dolphins. We’ve taught them to interpret our gestures, respond to verbal commands, and even imitate human sounds.

While dolphins seem capable of learning our language, we’re still trying to figure out theirs.

Maybe they could teach us a few things.
